(I) have neuroprotective, noctropic, vasotropic and cerebroprotective activities, and can be used in peptide therapy. The Harili peptide sequences can be used as analogues for NTP in therapeutic or diagnostic assays by replacing NTP with the peptide in such an assay. The Harili peptides are also useful as a trap material in a diagnostic or therapeutic assay. Therefore, the Harili peptides are useful in binding assays, protein and antibody purification, therapeutics or diagnostics. In particular, the peptides are also useful for diagnosing Alzheimer's disease, Down's syndrome, neuroectodermal tumours, astrocytomas, glioblastomas, hypoxia, ischaemia or cerebral infarction. The peptides are also useful as targets for drug development for the treatment of

The invention relates to a novel method for preventing and/or inhibiting cell death and/or tissue necrosis in a tissue comprising contacting the live tissue with at least one segment of neural thread proteins (NTP). The methods are composition are useful for treating a neurodegenerative disorder, such as Alzheimer's disease. This sequence represents an NTP peptide of the invention
                                                                                                      Nootropic; neuroprotective; cell death; tissue necrosis; NTP;
neural thread protein; neurodegenerative disorder; Alzheimer's disease.

having an amino acid sequence selected from ABBB1511 to ABBB1259 and their homologues, which are referred collectively as Harlil peptides (I) [1] have neuroprotective, nootropic, vasotropic and cerebroprotective activities, and can be used in peptide therapy. The Harlil peptide sequences can be used as analogues for NTP in therapeutic or diagnostic assays by replacing NTP with the peptide in such an assay. The Harlil peptides are also useful as a trap material in a diagnostic or therapeutic assay. Therefore, the Harlil peptides are useful in binding assays, protein and antibody purification, therapeutics or diagnostics. In particular, the peptides are also useful for diagnostics or dispostices. In particular, the peptides are also useful for diagnostics or dispostices. Since also useful sease, Down's syndrome, neurocetcodermal tumours, astrocytomas, glioblastomas, hypoxia, ischaemia or cerebral infarction. The peptides are also useful as targets for drug development for the treatment of
                           therapeutic assays, e.g. as targets for developing drugs for treating Alzheimer's disease, ischemia or cerebral infarction, or for diagnosing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Nootropic; neuroprotective; cell death; tissue necrosis; NTP;
neural thread protein; neurodegenerative disorder; Alzheimer's disease.
                                                                                                                                                                               The present invention describes a neural thread protein (NTP) peptide
  New Harlil peptide sequences of the Neural Thread Protein, useful in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Preventing and/or inhibiting cell death and/or tissue necrosis in a tissue for treating a neurodegenerative disorder, e.g. Alzheimer's disease, by contacting the live tissue with at least one segment of neural thread proteins (NTP).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        100.0%; Score 21; DB 5; Length 5; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a neural thread protein (NTP) peptide having an amino acid sequence selected from ABB81511 to ABB81529 and their homologues, which are referred collectively as Harlil peptides (I).

The paye neuroprotective, nootropic, vasotropic and cerebroprotective cativities, and can be used in peptide therapy. The Harlil peptide sequences can be used as analogues for NTP in therapeutic or diagnostic saspay by replacing NTP with the peptide in such an assay. The Harlil peptides are also useful as a trap material in a diagnostic or therapeutic assay. Therefore, the Harlil peptides are useful in binding assays, protein and antibody purification, therapeutics or diagnostics. In particular, the peptides are also useful in binding assays, protein and antibody purification, therapeutics or diagnostics. In particular, the peptides are also useful in for diagnosing Alzhaimer's disease, Down's syndrome, neuroectodermal tumours, astrocytomas, care also useful as targets for drug development for the treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                        New Harlil peptide sequences of the Neural Thread Protein, useful in therapeutic assays, e.g. as targets for developing drugs for treating Alzheimer's disease, ischemia or cerebral infarction, or for diagnosing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Neural thread protein (NTP) peptide #3.
```

The invention relates to a novel method for preventing and/or inhibiting cell death and/or tissue necrosis in a tissue comprising contacting the live tissue with at least one segment of neural thread proteins (NTP).

```
The present invention describes a neural thread protein (NTP) peptide having an amino acid sequence selected from ABB81511 to ABB81529 and their homologues, which are referred collectively as Harlil peptides (I) have neuroprotective, nootropic, vasotropic and cerebroprotective activities, and can be used in peptide therapy. The Harlil peptide sequences can be used as analogues for NTP in therapeutic or diagnostic assays by replacing NTP with the peptide in such an assay. The Harlil peptides are also useful as a trap material in a diagnostic or therapeutic assay. Therefore, the Harlil peptides are useful in binding assays, protein and antibody purification, therapeutics or diagnostics. In particular, the peptides are also useful for diagnostics diagnos. Down's syndrome, neurosctodermal tumours, astrocytomas, allobastomas, hypoxia, ischaemia or cerebral infarction. The peptides are also useful as targets for drug development for the treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New Harlil peptide sequences of the Neural Thread Protein, useful in therapeutic assays, e.g. as targets for developing drugs for treating Alzheimer's disease, ischemia or cerebral infarction, or for diagnosing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Neural thread protein, NTP; Harlil peptide; Alzheimer's disease; Down's syndrome; neuroectodermal tumour; astrocytoma; glioblastoma; hypoxia; ischaemia; cerebral infarction.

The present invention describes a neural thread protein (NTP) peptide having an amino acid sequence selected from ABBB1511 to ABBB1529 and their homologues, which are referred collectively as Harlil peptides (I) (I) have neuroprotective, nootropic, vasotropic and cerebroprotective activities, and can be used as analogues for NTP in therapeutic or diagnostic assays by replacing NTP with the peptide in such an assay. The Harlil peptides are also useful as a trap material in a diagnostic or therapeutic assays. The Harlil peptides are also useful as a trap material in a diagnostic or therapeutic assay. Therefore, the Harlil peptides are useful in binding assays, protein and antibody purification, therapeutics or diagnostics. In particular, the peptides are also useful for diagnostics.
                                                                                                                                                                                     New Harlil peptide sequences of the Neural Thread Protein, useful in therapeutic assays, e.g. as targets for developing drugs for treating Alzheimer's disease, ischemia or cerebral infarction, or for diagnosing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Nootropic; neuroprotective; cell death; tissue necrosis; NTP; neural thread protein; neurodegenerative disorder; Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            disease, Down's syndrome, neuroectodermal tumours, astrocytomas, glioblastomas, hypoxia, ischaemia or cerebral infarction. The peptides are also useful as targets for drug development for the treatment of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a neural thread protein (NTP) peptide having an amino acid sequence selected from ABB81511 to ABB81529 and thaving an amino acid sequence selected from ABB81511 to ABB81529 and the confective homologues, which are referred collectively as Harlil peptides (I).

(I) have neuroprotective, nootropic, vasotropic and cerebroprotective activities, and can be used in peptide therapy. The Harlil peptide sare also useful as a trap material in a diagnostic or therapeutic assay. Therefore, the Harlil peptides are useful in binding assays, protein and antibody purification, therapeutics or diagnostics.

In particular, the peptides are also useful for diagnostics.

In particular, the peptides are also useful for diagnostics.

Colloblastomas, hypoxia, ischaemia or cerebral infarction. The peptides are also useful as targets for drug development for the treatment of these diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                    New Harlil peptide sequences of the Neural Thread Protein, useful in therapeutic assays, e.g. as targets for developing drugs for treating Alzheimer's disease, ischemia or cerebral infarction, or for diagnosing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Neural thread protein; NTP; Harlil peptide; Alzheimer's disease;

The invention relates to a novel method for preventing and/or inhibiting cell death and/or tissue necrosis in a tissue comprising contacting the live tissue with at least one segment of neural thread proteins (NTP). The methods are composition are useful for treating a neurodegenerative disorder, such as Alzheimer's disease. This sequence represents an NTP peptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Nootropic; neuroprotective; cell death; tissue necrosis; NTP;

The present invention describes a neural thread protein (NTP) peptide having an amino acid sequence selected from ABBB1511 to ABBB1529 and their are referred collectively as Harili peptides [1].

(I) have neuroprotective, nootropic, vasotropic and cerebroprotective activities, and can be used in peptide therapy. The Harili peptide cequal sequences can be used as analogues for NTP in therapeutic or diagnostic assays by replacing NTP with the peptide in such an assay. The Harili peptides are also useful as a trap material in a diagnostic or therapeutic assay. Therefore, the Harili peptides are useful in binding assays, protein and antibody purification, therapeutics or diagnostics.

In particular, the peptides are also useful for diagnostic Assays, protein and antibods purification, therapeutics or diagnostics.

In particular, the peptides are also useful for diagnostic Alshamer's disease. Down's syndrome, neuroectodermal tumours, astrocytomas, are also useful as targets for drug development for the treatment of these diseases
                                          The invention relates to a novel method for preventing and/or inhibiting cell death and/or tissue necrosis in a tissue comprising contacting the live tissue with at least one segment of neural thread proteins (NTP). The methods are composition are useful for treating a neurodegenerative disorder, such as Alzheimer's disease. This sequence represents an NTP peptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New Harlil peptide sequences of the Neural Thread Protein, useful in therapeutic assays, e.g. as targets for developing drugs for treating Alzheimer's disease, ischemia or cerebral infarction, or for diagnosing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Neural thread protein; NTP; Harlil peptide; Alzheimer's disease;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes a neural thread protein (NTP) peptide having an amino acid sequence selected from ABBB1511 to ABBB1529 and their homologues, which are referred collectively as Harill peptides and carboroctective, nootropic, vasotropic and cerebroprotective activities, and can be used in peptide therapy. The Harill peptide activities and can be used in peptide therapy. The Harill peptide assays by replacing NTP with the peptide in such an assay. The Harill peptides are also useful as a trap material in a diagnostic or therapeutic assay. Therefore, the Harill peptides are useful in binding assays, protein and antibody purification, therapeutics or diagnostics. In particular, the peptides are also useful for diagnosing Alzheimer's disease, Down's syndrome, neuroectodermal tumours, astrocytomas, glioblastomas, hypoxia, ischaemia or cerebral infarction. The peptides are also useful as targets for drug development for the treatment of

peptide #8.

(first entry)

셤 ð

```
The present invention describes a neural thread protein (NTP) peptide having an amino acid sequence selected from ABB81511 to ABB81529 and their homologues, which are referred collectively as Harli peptides (I). (I) have neuroprotective, nootropic, vasotropic and cerebroprotective activities, and can be used in peptide therapy. The Harlil peptide casays by replacing NTP with the peptide in such an assay. The Harlil peptide says by replacing NTP with the peptide in such an assay. The Harlil peptides are also useful as a trap material in a diagnostic or therapeutic assay. Therefore, the Harlil peptides are useful in binding assays, protein and antibody purification, therapeutics or diagnostics. In particular, the peptides are also useful for diagnostics disease, Down's syndrome, neuroectodermal tumours, astrocytomas, glioblastomas, hypoxia, ischaemia or cerebral infarction. The peptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

```
The invention relates to a novel method for preventing and/or inhibiting cell death and/or tissue necrosis in a tissue comprising contacting the live tissue with at least one segment of neural thread proteins (NTP). The methods are composition are useful for treating a neurodegenerative disorder, such as Alzheimer's disease. This sequence represents an NTP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel method for preventing and/or inhibiting cell death and/or tissue necrosis in a tissue comprising contacting the live tissue with at least one segment of neural thread proteins (NTP). The methods are composition are useful for treating a neurodegenerative disorder, such as Alzheimer's disease. This sequence represents an NTP peptide of the invention

The invention relates to a novel method for preventing and/or inhibiting cell death and/or tissue necrosis in a tissue comprising contacting the live tissue with at least one segment of neural thread proteins (NTP). The methods are composition are useful for treating a neurodegenerative disorder, such as Alzheimer's disease. This sequence represents an NTP peptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               pic, neuroprotective, cell death, tissue necrosis, NTP, thread protein, neurodegenerative disorder; Alzheimer's disease.

The methods are composition are useful for treating a neurodegenerative disorder, such as Alzheimer's disease. This sequence represents an NTP peptide of the invention
                                                                                                                                                                                                                                                              Nootropic; neuroprotective; cell death; tissue necrosis; NTP;
neural thread protein; neurodegenerative disorder; Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

The invention relates to a novel method for preventing and/or inhibiting cell death and/or tissue necrosis in a tissue comprising contacting the live tissue with at least one segment of neural thread proteins (NTP). The methods are composition are useful for treating a neurodegenerative disorder, such as Alzheimer's disease. This sequence represents an NTP peptide of the invention

New Harlil peptide sequences of the Neural Thread Protein, useful in therapeutic assays, e.g. as targets for developing drugs for treating Alzheimer's disease, ischemia or cerebral infarction, or for diagnosing these diseases

Claim 3; Page 30; 53pp; English.

The present invention describes a neural thread protein (NTP) peptide having an amino acid sequence selected from ABBB1511 to ABBB1529 and their homologues, which are referred collectively as Harli peptides (I). (I) have neuroprotective, noctropic, vasotropic and cerebroprotective activities, and can be used in peptide therapy. The Harli peptide sequences can be used as analogues for NTP in therapeutic or diagnostic assays by replacing NTP with the peptide in such an assay. The Harlii peptides are also useful as a trap material in a diagnostic or therapeutic assay. Therefore, the Harlii peptides are useful in binding assays, protein and antibody purification, therapeutics or diagnostics. In particular, the peptides are also useful for diagnostics.

protease cleavage site motifs using a mixture-library. (BETH-) BETH ISRAEL DEACONESS MEDICAL CENT 08-NOV-2001; 2001WO-US046777. 08-NOV-2000; 2000US-0246815P. Rapid determination of based oriented peptide Purk BE, Cantley LC; WPI; 2002-519316/55 WO200238796-A2. Homo sapiens. 16-MAY-2002.

The invention relates to a method for determining an amino acid sequence motif for a cleavage site of a protease. The method comprises contacting the protease with a peptide library containing degenerate residues which allow for cleavage of a substrate by the protease, allowing the protease to cleave peptides which the degenerate peptide library having a cleavage site for the protease to form a population of cleaved peptides, and determining an amino acid sequence motif for the cleavage site of the protease. The protease of the method is a matrix metalloproteinase, or a protease. The protease of the method is a matrix and allopyroteinase, or a protease is a lethal factor of B. anthracis, pla and Yopy proteases of the invention is selected from a protease of pathogenic organisms, cathegein family protease, tumour necrosis factor-alpha converting enzyme (TACE), calpains, caspases, beta-site amyloid precursor protein cleaving enzyme (BACE, beta-secretase), presenting, membrane-type serine proteases, furin and other proprotein convertases, proteasome components and

The present invention describes a polypeptide (I) comprising a component selected from: (a) a polypeptide epitope having any of the 503 fully defined sequences of 8-13 amino acids (SEQ ID No:108-610); (b) an epitope cluster comprising the polypeptide of (a); (c) a polypeptide having substantial similarity to (a) or (b); (d) a polypeptide having functional similarity to any of (a)-(c); or (b) a nolypeptide having functional polypeptide of (a)-(l) (I) has virucide and cytostatic activities, and can be used in vaccines. The methods and compositions of the present invention are useful for the diagnosis and/or treatment of viral infections, cancers and tumours. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     epitope; epitope cluster; virucide; cytostatic; vaccine; viral infection; cancer; tumour; human; PRAME.

Selecting and/or producing a T cell epitope useful in a vaccine comprises subjecting a precursor peptide or polypeptide to the action of a 208 proteasome to determine the location of the C-terminus.
  Selecting and/or producing a T cell epitope useful in a vaccine comprises
                                                                                                                                 The present invention describes a method of producing T cell epitopes, involving subjecting a precursor peptide to the action of a 208 proceasome, in order to locate the C-terminus of said epitope. This can be used in the production of vaccines, which can then be used to provoke a T cell response in the treatment of diseases such as cancer and infections. The present sequence is a peptide described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes a method of producing T cell epitopes, involving subjecting a precursor peptide to the action of a 208 proteasome, in order to locate the C-terminus of said epitope. This can be used in the production of vaccines, which can then be used to provoke a T cell response in the treatment of diseases such as cancer and infections The present sequence is a peptide described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Vaccine; immune response; T cell response; epitope; proteasome; cancer;
                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                    subjecting a precursor peptide or polypeptide to the action of a 205 proteasome to determine the location of the C-terminus.
                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                         Length 9;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Score 21; DB 4; Length 9;

                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes a polypeptide (I) comprising a component defined sequences of \theta-13 amino acids (SEQ ID NO:108-610); (b) an epitope cluster comprising the polypeptide of (a); (c) a polypeptide having substantial similarity to (a) or (b); (d) a polypeptide having substantial similarity to (a) or (b); (d) a polypeptide having substantial similarity to (a) or (b); (d) a polypeptide having functional similarity to any of (a), (c); or (e) a nucleic acid encoding the polypeptide of (a)-(d). (I) has virucide and cytostatic activities, and can be used in vaccines. The methods and compositions of the present invention are useful for the diagnosts and/or treatment of viral infections, cancers and tumours. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                         New polypeptides and encoding nucleic acids that are useful epitopes of target-associated antigens, useful for diagnosing and/or treating viral infections, cancers and tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           response; T cell response; epitope; proteasome; cancer;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes a polypeptide (I) comprising a component selected from: (a) a polypeptide epitope having any of the 503 fully defined sequences of 6.33 amino acids (SEQ ID NO:108-610), (b) an epitope cluster comprising the polypeptide of (a); (c) a polypeptide having substantial similarity to (a) or (b); (d) a polypeptide having functional similarity to any of (a) (c); or (e) a uncleic acid encoding the polypeptide of (a)-(d), or (e) a nucleic acid encoding the polypeptide of (a)-(d). (I) has virucide and cytostatic activities, and can be used in vaccines. The methods and compositions of the present invention are useful for the disapnosis and/or treatment of viral infections, cancers and tumours. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                    epitope, epitope cluster, virucide, cytostatic, vaccine, viral infection, cancer, tumour, human, PRAME.
                                                                                                                                                                                                                                                                                                                                                                                                        New polypeptides and encoding nucleic acids that are useful epitopes of target-associated antigens, useful for diagnosing and/or treating viral infections, cancers and tumors.

(T) has vinucide and cytostatic activities, and can be used in vaccines. The methods and compositions of the present invention are useful for the diagnosis and/or treatment of viral infections, cancers and tumours. The present sequence is used in the exemplification of the present invention.
epitope; epitope cluster; virucide; cytostatic; vaccine; viral infection; cancer; tumour; human; PRAME.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 epitope, epitope cluster, virucide, cytostatic, vaccine, viral infection, cancer, tumour, human, PRAME.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New polypeptides and encoding nucleic acids that are useful epitopes of target-associated antigens, useful for diagnosing and/or treating viral infections, cancers and tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

The present invention describes a polypeptide (I) comprising a component selected from: (a) a polypeptide epitope having any of the 503 fully defined sequences of 8-33 amino acids (SEQ ID NO:108-610); (b) an epitope cluster comprising the polypeptide of (a); (c) a polypeptide having substantial similarity to (a) or (b); (d) a polypeptide having functional similarity to any of (a), (c); or (e) a nucleic acid encoding the polypeptide of (a) - (d), (1) has virucide and cytostatic activities, and can be used in vaccines. The methods and compositions of the present invention are useful for the disgnosts and/or trearment of viral infections, cancers and tumours. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            epitope; epitope cluster; virucide; cytostatic; vaccine; viral infection; cancer; tumour; human; PRAME.
                                                                                                                                 New polypeptides and encoding nucleic acids that are useful epitopes of target-associated antigens, useful for diagnosing and/or treating viral infections, cancers and tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New polypeptides and encoding nucleic acids that are useful epitopes of target-associated antigens, useful for diagnosing and/or treating viral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

             The present invention describes a polypeptide (I) comprising a component defined sequences of 8-33 amino acids (SEQ ID NO:108-610); (b) an epitope having any of the 503 fully defined sequences of 8-33 amino acids (SEQ ID NO:108-610); (b) an epitope cluster comprising the polypeptide of (a); (c) a polypeptide having substantial similarity to (a) or (b); (d) a polypeptide having functional similarity to any of (a) c(c); or (e) a mucleic acid encoding the polypeptide of (a) -(d). (I) has vincide and cytostatic activities, and can be used in vaccines. The methods and compositions of the present invention are useful for the diagnosis and/or treatment of viral infections, cancers and tumours. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes a polypeptide (I) comprising a component selected from: (a) a polypeptide epitope having any of the 503 fully defined sequences of 6-33 amino acids (SEQ ID NO:108-610); (b) an epitope cluster comprising the polypeptide of (a); (c) a polypeptide having substantial similarity to (a) or (b); (d) a polypeptide having functional similarity to any of (a)-(c); or (e) a nucleic acid encoding the polypeptide of (a)-(d). (I) has virucide and cytostatic activities, and can be used in vaccines. The methods and compositions of the present invention are useful for the diagnosis and/or treatment of viral infections, cancers and tumours. The present sequence is used in the exemplification of the present invention.

The invention relates to a novel method for generating, from a parent protein, a variant protein having desired immunological and functional protein, a variant protein having desired immunological and functional properties comprising one or more variant sequences comprising an amino acid substitution of a position of the first immunogenic content to the parent protein. The method comprises generating, from a parent protein, a variant protein having desired immunological and functional properties, the desired immunological property is reduced or enhanced immunogenicity. The immunogenic sequence or property is reduced or enhanced immunogenicity. The immunogenic sequence of selected from an antigen processing cleavage site, a class I MHC agretope, and an antibody epitope. The immunogenicity filter comprises a function that predicts antigen comprises a function that predicts antigen that predicts class I or class II MHC agretopes. The immunogenicity filter comprises a function that predicts antibody epitopes. The immunogenicity filter comprises a function that predicts antibody epitopes. The computational protein design algorithm comprises a scoring function with two or more computational protein design algorithm is used to assess the affinity of said variant protein for one or more receptor computational protein design algorithm is used to assess the affinity of said variant protein for one or more receptor computational protein design algorithm is used to assess the affinity of said variant protein design algorithm is used to assess the affinity of said variant protein design algorithm is used to assess the affinity of said variant protein design algorithm is used to assess the affinity of said variant protein design algorithm is computational protein design algorithm is used the variant protein to a patient. The method further comprises experimentally generating the variant protein to a patient. The method is useful for generating a

The invention relates to a novel method for generating, from a parent protein, a variant protein having desired immunological and functional protein, a variant protein having desired immunological and functional properties comprising generating one or more variant sequences comprising can amino acid substitution of a position of the first immunogenic can equence in the parent protein. The method comprises generating, from a parent protein having desired immunological and cuptake by antigen presenting cals (APCB). The desired immunological property is reduced or enhanced immunogenicity. The immunogenic sequence is selected from an antigen processing cleavage site, a class I MHC agretope, a class I MHC agretope, and an antibody epitope. The immunogenicity filter comprises a function that predicts antigen processing cleavage sites. The immunogenicity filter comprises a function that predicts comprises a function that predicts comprises a function of filter comprises a function that predicts antibody epitopes. The immunogenicity filter comprises a function that predicts antibody epitopes. The immunogenicity filter comprises a function that predicts antibody epitopes. The computational protein algorithm comprises a scoring function with two or more cramped and selected from the list: van der Waals, hydrogen bonding, centernal protein design algorithm is used to assess the stability of computational protein design algorithm is used to assess the stability of
                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Generating, from a parent protein, a variant protein having desired immunological and functional properties, comprises generating one or more variant sequences with an amino acid substitution in the parent protein.
variant protein with altered immunogenicity, preferably for identifying modifications that increase or decrease the immunogenicity of a protein by affecting antigen uptake. The present sequence represents a class II MHC-binding peptide from human ciliary neurotrophic factor (CNTF).
                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human CNTF class II MHC-binding less immunogenic variant #139.

The invention relates to a novel method for generating, from a parent protein, a variant protein having desired immunological and functional protein, a variant protein naving desired immunological and functional an amino acid substitution of a position of the first immunogenic sequence in the parent protein. The method comprises generating, from a sequence in the parent protein. The method comprises generating, from a sequence in the parent protein having desired immunological and functional properties, the desired immunological property is ended or enhanced immunogenicity. The immunogenic sequence is selected from an antigen processing cleavage site, a class I MHC agretope, and an antibody epitope. The agretope, a class II MHC agretope, and an antibody epitope. The processing cleavage sites, a class I MHC agretope, and that predicts antigen processing cleavage sites. The immunogenicity filter comprises a function that predicts antigen processing cleavage sites. The immunogenicity filter comprises a function that predicts class I or class II MHC agretopes. The immunogenicity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Generating, from a parent protein, a variant protein having desired immunological and functional properties, comprises generating one or more variant sequences with an amino acid substitution in the parent protein.
said variant protein. The computational protein design algorithm is used to assess the affinity of said variant protein for one or more receptor or ligand molecules. The computational protein design algorithm is PDA (RTM) technology. The method further comprises experimentally generating the variant protein, recovering the variant protein, and administering the variant protein to a patient. The method is useful for generating a variant protein with altered immunogenicity, preferably for identifying modifications that increase or decrease the immunogenicity of a protein by affecting antigen uptake. The present sequence represents a class II MHC-binding peptide from human ciliary neurotrophic factor (CNTF).
                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                     ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               class II MHC-binding less immunogenic variant #129.

                                                                           electrostation, solvation, and secondary structure propendity. The computational protein design algorithm is used to assess the stability of said variant protein design algorithm is used to assess the affinity of said variant protein for one or more receptor or ligand molecules. The computational protein design algorithm is PDA or ligand molecules. The computational protein design algorithm is PDA (RTM) technology. The method further comprises experimentally generating the variant protein, recovering the variant protein, and administering the variant protein with altered immunogenicity, preferably for identifying modifications that increase or decrease the immunogenicity of a protein by affecting antigen uptake. The present sequence represents a class II MHC-binding peptide from human ciliary neurotrophic factor (CNTF).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Generating, from a parent protein, a variant protein having desired immunological and functional properties, comprises generating one or more variant sequences with an amino acid substitution in the parent protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a novel method for generating, from a parent protein, a variant protein having desired immunological and functional properties comprising generating one or more variant sequences comprising an amino acid substitution of a position of the first immunogenic sequence in the parent protein. The method comprises generating, from a parent protein, a variant protein having desired immunological and functional properties, the desired immunological senanced uptake by antigen presenting cells (APCs). The desired immunological
                   comprises a function that predicts antibody epitopes. The computational protein design algorithm comprises a scoring function with two or more terms selected from the list: van der Waals, hydrogen bonding,

property is reduced or enhanced immunogenicity. The immunogenic sequence is selected from an antigen processing cleavage site, a class I MHC agretope, and an antibody epitope. The immunogenicity filter comprises a function that predicts antigen cleavage sites. The immunogenicity filter comprises a function that predicts antigen comprises a matrix method calculation. The immunogenicity filter comprises a matrix method calculation. The immunogenicity filter comprises a matrix method calculation. The computational comprises a scoring function with two or more computational algorithm comprises a scoring function with two or more terms selected from the list: van der Waals, hydrogen bonding, clearcastatics, solvation, and secondary structure propensity. The computational protein design algorithm is used to assess the affinity of said variant protein. The computational protein design algorithm is used to assess the affinity of said variant protein design algorithm is DDA (RTW) technology. The method further comprises experimentally generating the variant protein in ecovering the variant protein, and administering the variant protein with altered immunogenicity, preferably for identifying contained protein with altered immunogenicity, of a protein contains that increase or decrease the immunogenicity of a protein contained by affecting antigen uptake. The present sequence represents a class II MC. MHC-binding peptide from human ciliary neurotrophic factor (CNTF).

The invention relates to a novel method for generating, from a parent protein, a variant protein having desired immunological and functional

```
properties comprising generating one or more variant sequences comprising an amino acid substitution of a position of the first immunogenic sequence in the parent protein. The method comprises generating, from a parent protein. The method comprises generating, from a cuptake by antique presenting cells (APCB). The desired immunological and tunctional property is cells (APCB). The desired immunological and property is reduced or enhanced immunogenicity. The immunogenic sequence is selected from an antigen processing cleavage site, a class I MHC agrecope, and an antibody epitope. The immunogenic sequence is menopenicity filter comprises a function that predicts antigen processing cleavage sites. The immunogenicity filter comprises a function that predicts antibody epitopes. The immunogenicity filter comprises a function that predicts antibody epitopes. The immunogenicity filter comprises a function that predicts antibody epitopes. The immunogenicity filter comprises a function that predicts antibody epitopes. The immunogenicity filter comprises a function that predicts antibody epitopes. The immunogenicity filter comprises a function that predicts antibody epitopes. The immunogenicity filter comprises a function that predicts antibody epitopes. The semple for more computational protein design algorithm is used to assess the stability of said variant protein. The computational protein design algorithm is used to assess the affinity of said variant protein in the computational protein design algorithm is protein. Lechnology. The method further comprises experimentally generating the variant protein to a patient. The method is useful for generating the variant protein with altered immunogenity, preferably for identifying modifications that increase or decrease the immunogenicity of a protein by affecting antigen uptake. The present sequence represents a class II MHC-binding peptide from human ciliary neurotroposicity of a protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Generating, from a parent protein, a variant protein having desired immunological and functional properties, comprises generating one or more

Generating, from a parent protein, a variant protein having desired immunological and functional properties, comprises generating one or more variant sequences with an amino acid substitution in the parent protein.

Marshall SA;

Desjarlais JR,

Dahiyat BI,

Chirino AJ,

WPI; 2004-571511/55.

The invention relates to a novel method for generating, from a parent protein, a variant protein having desired immunological and functional properties comprising generating one or more variant sequences comprising an amino acid substitution of a position of the first immunogenic an amino acid substitution of a position of the first immunogenic properties, the desired immunological and functional properties, the desired immunological property is enhanced uptake by antigen presenting cells (APCS). The desired immunological or property is reduced or enhanced immunogenicity. The immunogenic sequence is selected from an antigen processing cleavage site, a class I MHC agretope, and an antibody epitope. The immunogenicity filter comprises a function that predicts antigen that predicts clasvage sites. The immunogenicity filter comprises a matrix method calculation. The immunogenicity filter comprises a social function with two or more terms selected from the list: van der Waals, hydrogen bonding.

Comprises a function that predicts antibody epitopes. The computational protein design algorithm comprises a scoring function with two or more computational protein design algorithm is used to assess the affinity of said variant protein for one or more receptor or ligand molecules. The computational protein design algorithm is used to assess the affinity of said variant protein, recovering the variant protein, and administering the variant protein, recovering the variant protein, and administering considering the variant protein with altered immunogenicity, preferably for identifying modifications that increase or decrease the immunogenicity, of a protein con by affecting antigen uptake. The method is useful for generating a class II method further some protein receptor the variant protein with altered immunogenicity, preferably for variant sequences with an amino acid substitution in the parent protein. Human CNTF class II MHC-binding less immunogenic variant #138. immunogenic; antigen presenting cell; APC; antigen processing cleavage site; class I MHC agretope; class II MHC agretope; antibody epitope; CNTF; ciliary neurotrophic factor. 100.0%; Score 21; DB 8; I 100.0%; Pred. The invention relates to a novel method for generating, from a parent protein, a variant protein having desired immunological and functional protein, a variant protein having desired immunological and functional comprising generating one or more variant sequences comprising an amino acid substitution of a position of the first immunogenic content protein, a variant protein. The method comprises generating, from a parent protein having desired immunological and functional properties, the desired immunological property is enhanced uptake by antigen presenting cells (APCB). The desired immunological compressed or enhanced immunogenicity. The immunogenic sequence is selected from an antigen processing cleavage site, a class I MHC agretope, and an antibody epitope. The immunogenicity filter comprises a function that predicts antigen processing cleavage sites. The immunogenicity filter comprises a function that predicts antigen comprises a function that predicts class I MHC agretopes. The immunogenicity filter comprises a function that predicts class I we class I MHC agretopes. The immunogenicity filter comprises a function that predicts antibody epitopes. The computational comprises a scoring function with two or more computational algorithm comprises a scoring function with two or more computational protein design algorithm is used to assess the affinity of said variant protein design algorithm is used to assess the affinity of said variant protein design algorithm is broad or more receptor con I ligand molecules. The computational protein design algorithm is a variant protein for one or more receptor con I ligand molecules. The computational protein design algorithm is a variant protein for mark form. I may be an advantance and a protein design algorithm is a variant protein for mark form. (RTW) technology. The method further comprises experimentally generating the variant protein, recovering the variant protein, and administering the variant protein to a patient. The method is useful for generating a variant protein with altered immunogenicity, preferably for identifying amoffications that increase or decrease the immunogenicity of a protein by affecting antigen uptake. The present sequence represents a class II MHC-binding peptide from human ciliary neurotrophic factor (CNTF). Human CNTF class II MHC-binding less immunogenic variant #145. 100.0%; Score 21; DB 8; Length 9; 100.0%; Pred.                                                                                                                                                                                                                                                The invention relates to a novel method for generating, from a parent protein, a variant protein having desired immunological and functional protein, a variant protein naving desired immunological and a maino acid substitution of a postition of the first immunogenic comprising an amino acid substitution of a postition of the first immunogenic from a parent protein, a variant protein having desired immunological and that predicts property is reduced or enhanced immunological property is reduced or enhanced immunogenic sequence is selected from an antigen processing cleavage site, a class I MHC agretope, and an antibody epitope. The immunogenic sequence is selected from an antigens a function that predicts attigen processing cleavage sites. The immunogenicity filter comprises a function that predicts class I MHC agretopes. The immunogenicity filter comprises a matrix method calculation. The immunogenicity filter comprises a matrix method calculation. The immunogenicity filter comprises a function that predicts antibody epitopes. The immunogenicity filter comprises a function that predicts antibody epitopes. The immunogenicity class a function that predicts antibody epitopes. The computational protein design algorithm comprises a scoring function with two or more computational protein design algorithm is used to assess the affinity of selected from the list: van der Waals, hydrogen bonding, computation, and secondary structure propensity. The computation protein design algorithm is used to assess the affinity of selected immunogenicity, preferably for identifying the variant protein design algorithm is used to assess the affinity of selected immunogenicity, preferably for identifying modifications that increase or decrease the immunogenicity of a protein by affectin with altered immunogenicity, preferably for identifying modifications that increase or decrease the immunogenicity, of a protein by affecting antigen bundare. The method is used to assessing a desertion by affecting antigen human ciliary neurotrophic f
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                              or more
                                                                                                                                                           Generating, from a parent protein, a variant protein having desired immunological and functional properties, comprises generating one or more variant sequences with an amino acid substitution in the parent protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The invention relates to a novel method for generating, from a parent protein, a variant protein having desired immunological and functional protein, a variant protein naving desired immunological and functional properties comprising generating one or more variant sequences comprising an amino acid substitution of a position of the first immunogenic comprising generating protein. The method comprises generating, from a parent protein, a variant protein having desired immunological and functional properties, the desired immunological and functional property is reduced or enhanneced immunogenic stry. The immunogenic sequence is selected from an antigen processing cleavage site, a class I MHC agretope, a class II MHC agretope, and an antibody epitope. The cimmunogenic stry filter comprises a function that predicts antigen processing cleavage sites. The immunogenicity filter comprises a function that predicts of the predicts class I or class II MHC agretopes. The immunogenicity filter comprises a marrix method calculation. The immunogenicity filter comprises a function that predicts antibody epitopes. The computational protein design algorithm comprises a scoring function with two or more terms selected from the list; van der Maals, hydrogen bonding, computation; solvation, and secondary structure propensity. The computation; the same protein design algorithm is used to assess the affinity of said variant protein design algorithm is velocity of the variant protein, the computational protein design algorithm is PDA (RTM) technology. The method further comprise experimentally generating the variant protein to a patient. The method is useful for generating a variant protein with altered immunogenicity, preferably for identifying modifications that increase or decrease the immunogenicity of a protein by affecting subjection between the immunogenicity, preferably for identifying modifications that increase or decrease the immunogenicity, preferably for identified in the variant protein but human cillary neurotrophic fac
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  immunological and functional properties, comprises generating one or more variant sequences with an amino acid substitution in the parent protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

The invention relates to a novel method for generating, from a parent protein, a variant protein having desired immunological and functional apportatios comprising generating one or more variant sequences comprising an amino acid substitution of a postion of the first immunogenic properties comprising one or more variant sequences comprising aguence in the parent protein. The method comprises generating, from a parent protein. The method comprises generating, from a parent protein having desired immunological and functional properties, the desired immunological property is reduced or enhanced immunogenicity. The immunogenic sequence is selected from an antigen processing cleavage site, a class I MHC agretope, and an antibody epitope. The immunogenicity filter comprises a function that predicts antigen processing cleavage sites. The immunogenicity filter comprises a function that predicts antibody epitopes. The immunogenicity filter comprises a matrix method calculation. The immunogenicity filter comprises a function that predicts antibody epitopes. The computational protein design algorithm comprises a scoring function with two or more computational protein design algorithm is used to assess the stability of said variant protein. The computational protein for one or more receptor or ligand molecules. The computational protein for one or more receptor or ligand molecules. The computational protein design algorithm is used to assess the affinity of said variant protein for one or more receptor or ligand molecules. The computational protein design algorithm is the variant protein to a patient. The method is useful for generating the variant protein with altered immunogenicity, preferably for identifying modifications that increase or decrease the immunogenicity of a protein by affecting antigen uptake. The present sequence represents a class I

one or more Generating, from a parent protein, a variant protein having desired immunological and functional properties, comprises generating one or mor variant sequences with an amino acid substitution in the parent protein.

Example 8; Page 64; 69pp; English.

The invention relates to a novel method for generating, from a parent protein, a variant protein having desired immunological and functional properties comprising one or more variant sequences comprising an amino acid substitution of a postition of the first immunogenic sequence in the parent protein. The method comprises generating, from a parent protein, a variant protein having desired immunological and functional properties, the desired immunological property is enhanced comprises immunogenic sequence by antigen presenting cells (APCs). The desired immunological comprises by antigen processing cleavage site, a class I MHC agretope, and an antibody epitope. The immunogenic sequence comprises II MHC agretope, and an antibody epitope. The immunogenicity filter comprises a function that predicts antigen processing cleavage sites. The immunogenicity filter comprises a function that predicts antigen comprises a matrix method calculation. The immunogenicity filter comprises a matrix method calculation. The immunogenicity filter comprises a function that predicts antibody epitopes. The computational protein design algorithm comprises a scoring function with two or more content of the predict of the list; wan der Waals, Mydrogen bonding, where the computational content of the computation chain and computational content of the computation chain and computation chain computation chain computation chain computational content of the computational content of the computation chain computation chain computation chain computation chain computation chain content of the computational content of the computation chain computation chain content of the computational content of the computation chain co electrostatics, solvation, and secondary structure propensity. The computational protein design algorithm is used to assess the stability of said variant protein design algorithm is used to assess the affinity of said variant protein for one or more receptor or ligand molecules. The computational protein for one or more receptor (RTM) technology. The method further comprises experimentally generating the variant protein, recovering the variant protein, and administering a the variant protein to a patient. The method is useful for generating a variant protein with altered immunogenicity, preferably for identifying modifications that increase or decrease the immunogenicity of a protein by affecting antigen uptake. The present sequence represents a class II MHC-binding peptide from human ciliary neurotrophic factor (CNTF).

The invention relates to a novel method for generating, from a parent protein, a variant protein having desired immunological and functional and properties comprising an amino acid substitution of a postition of the first immunogenic comprising sequence in the parent protein. The method comprises generating, from a sequence in the parent protein. The method comprises generating, from a sequence in the parent protein. The method comprises generating, from a functional property is reduced or chalanced immunological property is endicated or chalanced immunological property is reduced or chalanced immunogenicity. The immunogenic sequence is selected from an antigen processing cleavage site, a class I MHC agretope, and an antibody epitope. The immunogenicity filter comprises a function that predicts antigen that predicts class I MHC agretope. The immunogenicity filter comprises a function that predicts antigen that predicts class I or class II MHC agretopes. The immunogenicity filter comprises a matrix method calculation. The immunogenicity filter comprises a matrix method calculation. The immunogenicity filter comprises a function that predicts antibody epitopes. The computational protein design algorithm comprises a scoring function with two or more than selected from the list; van der Waals, hydrogen bonding, man antibody epitope. computational protein design algorithm is used to assess the stability of computational protein design algorithm is used to assess the stability of assess the affairty of said variant protein design algorithm is used to assess the affairty of said variant protein for one or more receptor or ligand molecules. The computational protein design algorithm is PDA (RTM) technology. The method further comprises experimentally generating the variant protein, and administering the variant protein to a patient. The method is useful for generating a variant protein with altered immunogenicity, preferably for identifying

The invention relates to a novel method for generating, from a parent protein, a variant protein having desired immunological and functional protein, a variant protein having desired immunological and functional comprising generating one or more variant sequences comprising an amino acid substitution of a position of the first immunogenic sequence in the parent protein. The method comprises generating, from a parent protein, a variant protein having desired immunological and functional properties, the desired immunological property is enhanced upractional property is reduced or enhanced immunogenicity. The immunogenic sequence is selected from an antigen processing cleavage site, a class I MHC agretope, and an antibody epitope. The immunogenicity filter comprises a function that predicts antigen processing cleavage sites and the immunogenicity filter comprises a function that predicts antigen comprises a matrix method calculation. The immunogenicity filter
                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Generating, from a parent protein, a variant protein having desired immunological and functional properties, comprises generating one or more variant sequences with an amino acid substitution in the parent protein.
to assess the affinity of said variant protein for one or more receptor or ilgand molecules. The computational protein design algorithm is PDA (RTM) technology. The method further compurises experimentally generating the variant protein, recovering the variant protein, and administering the variant protein to a patient. The method is useful for generating a variant protein with altered immunogenicity, preferably for identifying modifications that increase or decrease the immunogenicity of a protein by affecting antigen uptake. The present sequence represents a class II MHC-binding peptide from human ciliary neurotrophic factor (CNTF).
                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                      ö

Generating, from a parent protein, a variant protein having desired immunological and functional properties, comprises generating one or more variant sequences with an amino acid substitution in the parent protein.

WPI; 2004-571511/55.

The invention relates to a novel method for generating, from a parent protein, a variant protein having desired immunological and functional properties comprising generating one or more variant sequences comprising an amino acid substitution of a position of the first immunogenic sequence in the parent protein. The method comprises generating, from a parent protein, a variant protein having desired immunological and functional properties, the desired immunological property is enhanced uptake by antigen presenting calls (APCs). The desired immunological property is reduced or enhanced immunogenicity. The immunological English. Example 8; Page 61; 69pp;

is selected from an antigen processing cleavage site, a class I MHC agretope, and an antibody epitope. The immunogenicity filter comprises a function that predicts antigen processing cleavage sites. The immunogenicity filter comprises a function processing cleavage sites. The immunogenicity filter comprises a matrix method calculation. The immunogenicity filter comprises a matrix method calculation. The immunogenicity filter comprises a function that predicts antibody epitopes. The computational protein design algorithm comprises a scoring function with two or more cerms selected from the list: van der Mals, hydrogen bonding. The computational protein design algorithm is used to assess the stability of all variant protein. The computational protein design algorithm is used to assess the affinity of said variant protein for one or more receptor or ligand molecules. The computational protein design algorithm is PDA (RTM) technology. The method further comprises experimentally generating the variant protein to a patient. The method is useful for generating the variant protein to a patient. The method is useful for generating a variant protein with altered immunogenicity, preferably for identifying modifications that increase or decrease the immunogenicity of a protein by affecting antigen uptake. The present sequence represents a class II MHC-binding peptide from human ciliary neurotrophic factor (CNTF).

having an amino acid sequence selected from ABBB1511 to ABBB1529 and their homologues, which are referred collectively as Harlil peptides (I).

Their homologues, which are referred collectively as Harlil peptides (I).

Cativities, and can be used in peptide therapy. The Harlil peptide cativities, and can be used in peptide therapy. The Harlil peptide sequences can be used as analogues for NTP in therapeutic or diagnostic assays by replacing NTP with the peptide in auch an assay. The Harlil peptides are also useful as a trap material in a diagnostic or therapeutic assay. Therefore, the Harlil peptides are useful in binding assays, protein and antibody purification, therapeutics or diagnostics.

In particular, the peptides are also useful for diagnosing Alzheimer's disease, Down's syndrome, neuroectodermal tumours, astrocytomas, glioblastomas, hypoxia, isochaemia or cerebral infarction. The peptides are also useful as targets for drug development for the treatment of these diseases. The present sequence represents a specifically claimed
                                                                                                                                                                                                                                                                                 ö
                                   The present invention describes a method of producing T cell epitopes, involving subjecting a precursor peptide to the action of a 20S proteasome, in order to locate the C-terminus of said epitope. This can be used in the production of vaccines, which can then be used to provoke a T cell response in the treatment of diseases such as cancer and infections. The present sequence is a peptide described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        therapeutic assays, e.g. as targets for developing drugs for treating Alzheimer's disease, ischemia or cerebral infarction, or for diagnosing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes a neural thread protein (NTP) peptide

The present invention describes a polypeptide (I) comprising a component selected from: (a) a polypeptide epitope having any of the 503 fully defined sequences of 8-13 amino acids (SEQ ID NO:108-610); (b) an epitope cluster comprising the polypeptide of (a); (c) a polypeptide having substantial similarity to (a) or (b); (d) a polypeptide having functional similarity to any of (a) -(c); or (e) a mucleic acid encoding the polypeptide of (a) -(d). (I) has vinucide and cytostatic activities, and can be used in vaccines. The methods and compositions of the present invention are useful for the diagnosis and/or treatment of viral infections, cancers and tumours. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               epitope; epitope cluster; virucide; cytostatic; vaccine; viral infection; cancer; tumour; human; PRAME.
                                                                   epitope, epitope cluster; virucide, cytostatic; vaccine, viral infection; cancer; tumour; human; PRAME.
                                                                                                                                                                                                                                                                                                                                                                                                                                         New polypeptides and encoding nucleic acids that are useful epitopes of target-associated antigens, useful for diagnosing and/or treating viral infections, cancers and tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Length 10;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Indels

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a novel method for preventing and/or inhibiting cell death and/or tissue necrosis in a tissue comprising contacting the live tissue with at least one segment of neural thread proteins (NTP). The methods are composition are useful for treating a neurodegenerative disorder, such as Alzheimer's disease. This sequence represents an NTP peptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                          Nootropic, neuroprotective, cell death, tissue necrosis, NTP, neural thread protein, neurodegenerative disorder, Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                 Gaps

The present invention describes a polypeptide (I) comprising a component selected from: (a) a polypeptide epitope having any of the 503 fully defined sequences of 8-33 amino acids (SEQ ID NO:108-610); (b) an epitope cluster comprising the polypeptide of (a); (c) a polypeptide having substantial similarity to (a) or (b); (d) a polypeptide having functional similarity to any of (a) -(c); or (e) a nucleic acid encoding the polypeptide of (a)-(d); (I) has virucide and cytostatic activities, and can be used in vaccines. The methods and compositions of the present invention are useful for the diagnosis and/or treatment of viral infections, cancers and tumours. The present sequence is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes a polypeptide (I) comprising a component defined from: (a) a polypeptide epitope having any of the 503 fully defined sequences of 8-33 amino acids (SEQ ID NO:108-610); (b) an epitope cluster comprising the polypeptide of (a); (c) a polypeptide having substantial similarity to (a) or (b); (d) a polypeptide having similarity to any of (a)-(c); or (e) a muchelc acid encoding the polypeptide of (a)-(d). (I) has vinucide and cytostatic activities, can be used in vaccines. The methods and compositions of the present invention are useful for the diagnosis and/or treatment of viral infections, cancers and tumours. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           epitope; epitope cluster; virucide; cytostatic; vaccine; viral infection; cancer; tumour; human; PRAME.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New polypeptides and encoding nucleic acids that are useful epitopes of target-associated antigens, useful for diagnosing and/or treating viral infections, cancers and tumors.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                          The present invention describes a polypeptide (I) comprising a component selected from: (a) a polypeptide epitope having any of the 503 fully defined sequences of 8-33 amino acids (SEQ ID NO:108-610); (b) an epitope cluster comprising the polypeptide (a); (C) a polypeptide having substantial similarity to (a) or (b); (d) a polypeptide having functional similarity to any of (a)-(c); or (e) a nucleic acid encoding the polypeptide of (a)-(d). (I) has virucide and cytostatic activities, and can be used in vaccines. The methods and compositions of the present invention are useful for the diagnosis and/or treatment of viral infections, cancers and tumours. The present sequence is used in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to novel peptides (1; ADP04313-ADP04324)
which are recognized by autoantibodies (AAb) directed against human
thyroperoxidase (hTPO). (I) comprise a discontinuous epitope derived from
the discontinuous immunodominant region of hTPO, consisting of four
distinct regions that are homologous to MPO (myeloperoxidase) or CCP
(complement-control protein). (I) contain at least one of the cryptic
motifs given in ADP04325-ADP04327. The discontinuous epitope comprises
hTPO regions 353-363 (ADP04309); 377-386 (ADP04310) and 713-720
(ADP04311) of the MPO homology domain and 766-775 (ADP04312) of the CCP
homology domain. (I) are used to detect AAb, particularly for diagnosis
of autoimmune diseases (especially of the thyroid, e.g. Graves' and
antimoto diseases) or thyroid cancers. Also (I), and anti-TPO antibodies
that recognize them, are useful for treating these diseases. To
illustrate the invention, TPO mutaits were made. The present sequence is
the wild-type peptide sequence which was replaced with the ADP04328
                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New peptides recognized by autoantibodies against human thyroperoxidase, useful for diagnosis and treatment of autoimmune diseases and thyoid cancer, also antibodies specific for them.

The present sequence represents a peptide ligand which binds to human MUC1 protein. MUC1 is an epithelial cell mucin, which is found on, and shed from, the surface of many tumours. MUC1 peptide ligands were isolated using a phage display technique using MUC1 tandem repeats as the target. The MUC1 tandem target repeats comprise repeats of the peptide AAB31288. The ligands are useful for detecting the presence of MUC1 in a sample, to treat or prevent cancer associated with MUC1 and to prepare associated with MUC1 and to prepare associated with MUC1. By assaying for the binding between the MUC1 ligand and MUC1 in a sample diagnosis or monitoring of cancer can be carried out. The ligands may also be used to prepare antibodies
                                                                                                                                                                                                                                                                       Novel ligands that binds to MUC1, an epithelial cell mucin, useful for diagnosing, monitoring, treating and preventing cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

```
The invention relates to a novel method for preventing and/or inhibiting cell death and/or tissue necrosis in a tissue comprising contacting the live tissue with at least one segment of neural thread proteins (NTP). The methods are composition are useful for treating a neurodegenerative disorder, such as Alzheimer's disease. This sequence represents an NTP peptide of the invention
                                                                                                                        Preventing and/or inhibiting cell death and/or tissue necrosis in a tissue for treating a neurodegenerative disorder, e.g. Alzheimer's disease, by contacting the live tissue with at least one segment of neural thread proteins (NTP).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                         having an amino acid sequence selected from the present the present invention and amino acid sequence selected from ABBB1511 to ABBB1529 and their homologues, which are referred collectively as Harili peptides (I).

(I) have neuroprotective, nootropic, vasotropic and cerebroprotective activities, and can be used in peptide therapy. The Harili peptide sequences can be used as analogues for NTP in therapeutic or diagnostic assays by replacing NTP with the peptide in such an assay. The Harili peptides are also useful as a trap material in a diagnostic or therapeutic assay. Therefore, the Harili peptides are useful in binding assays, protein and antibody purification, therapeutics or diagnostics in particular, the peptides are also useful for diagnosing Alzheimer's disease, Down's syndrome, neuroectodermal tumours, astrocytomas.
                                                                                                                                                                                                                                                          New Harlil peptide sequences of the Neural Thread Protein, useful in therapeutic assays, e.g. as targets for developing drugs for treating Alzheimer's disease, ischemia or cerebral infarction, or for diagnosing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Nootropic; neuroprotective; cell death; tissue necrosis; NTP; neural thread protein; neurodegenerative disorder; Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          glioblastomas, hypoxia, ischaemia or cerebral infarction. The peptides are also useful as targets for drug development for the treatment of these diseases. The present sequence represents a specifically claimed peptide from the present invention
                                                                                                                                                                                                                                                                                                                                                                   The present invention describes a neural thread protein (NTP) peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The present invention relates to human nucleic acids containing single nucleotide polymorphisms (SNPs). These can be used in forensic and paternity tests, and to aid in the treatment of diseases associated with aberrant protein expression, including cancer, amyloidosis, diabetes, Alzheimer's disease, Down's syndrome, oedema, lupus (SLE), vasculitis, glomerulonephritis, haemolytic anaemia, thrombocytopaenia, arthritis, meningitis, muscular disorders, dementia, neurological diseases, tuberous sclerosis, male infertility, hypercalcaemia, blood pressure disorders, autoimmunity. The present sequence is a peptiide encoded by a polymorphism-containing oligonucleotide fragment of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Isolated human polynucleotides containing single nucleotide polymorphisms, useful for the treatment and diagnosis of e.g. cancer,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a novel method for preventing and/or inhibiting cell death and/or tissue necrosis in a tissue comprising contacting the live tissue with at least one segment of neural thread proteins (NTP). The methods are composition are useful for treating a neurodegenerative disorder, such as Alzheimer's disease. This sequence represents an NTP
their homologues, which are referred collectively as Harlil peptides (I) (I) have neuroprotective, nootropic, vasotropic and cerebroprotective activities, and can be used in peptide therapy. The Harlil peptide sequences can be used as analogues for NTP in therapeutic or diagnostic assays by replacing NTP with the peptide in such an assay. The Harlil peptides are also useful as a trap material in a diagnostic or therapeutic assay. Therefore, the Harlil peptides are useful in binding assays, protein and antibody purification, therapeutics or diagnostics. In particular, the peptides are also useful for diagnosing Alzheimer's disease, Down's syndrome, neuroectodermal tumours, astrocytomas, glioblastomas, hypoxia, ischaemia or cerebral infarction. The peptides are also useful as targets for drug development for the treatment of these diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Nootropic; neuroprotective; cell death; tissue necrosis; NTP;

The present invention describes a neural thread protein (NTP) peptide having an amino acid sequence selected from ABBB151 to ABBB1529 and their homologues, which are referred collectively as Harlil peptides and criticis, and can be used in peptide therapy. The Harlil peptide activities, and can be used in peptide therapy. The Harlil peptide sequences can be used as analogues for NTP in therapeutic or diagnostic sequences can be used in peptide in such an assay. The Harlil peptide are also useful as a trap material in a diagnostic or therapeutic assay. Therefore, the Harlil peptides are useful in binding therapeutic assay. Threfore, the Harlil peptides are useful in binding assays, protein and antibody purification, therapeutics or diagnostics. In particular, the peptides are also useful for diagnosing Alzhelmer's disease, Down's syndrome, neuroectodermal tumours, astrocycomas, calbobatemas, hypoxica, ischaemia or cerebral infarction. The peptides are also useful as targets for drug development for the treatment of these also useful as present sequence represents a specifically claimed
                                                                                                                                                                                                                             New Harlil peptide sequences of the Neural Thread Protein, useful in therapeutic assays, e.g. as targets for developing drugs for treating Alzheimer's disease, ischemia or cerebral infarction, or for diagnosing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Neural thread protein; NTP-peptide; AD7C-NTP; surgical excision; transplantation; grafting; chemotherapy; immunotherapy; vaccination; ablation; cryotherapy; laser therapy; photocherapy; gene therapy; radiation; tumour; hyperplasia; hypertrophy; overgrowth of tissue; malformation of tissue; tonsillary hypertrophy; prostatic hyperplasia; cosmetic modification; vascular disease; atherosclerosis; arteriosclerosis; heemorrhoid; varicose vein; inflammatory disease; autoimmune disease; metabolic disease; traumatic disease; physical injury; nutritional deficiency disease; infectious disease; amyloid disease; travase disease; congenital malformation; enzyme deficiency disease; polsoning; intoxication; environmental disease; radiation disease; intoxication; environmental disease; radiation disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               endocrine disease; degenerative disease; mechanical disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         100.0%; Score 21; DB 5; Length 14; Similarity 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to human nucleic acids containing single nucleotide polymorphisms (SNPs). These can be used in forensic and paternity tests, and to aid in the treatment of diseases associated with aberrant protein expression, including cancer, amyloidosis, diabetes, Alzheimer's disease, Down's syndrome, oedema, lupus (SLB), vasculitis, glomerulonephritis, haemolytic anaemia, thrombocytopaenia, arthritis, meningitis, muscular disorders, dementia, neurological diseases, tuberous seteoporosis, male infertility, hypercalcaemia, blood pressure disorders, seteoporosis, pathogenic infections, hypercholesterolaemia, obesity or autoimmunity. The present sequence is a peptide encoded by a polymorphism-containing oligonucleotide fragment of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Isolated human polynucleotides containing single nucleotide polymorphisms, useful for the treatment and diagnosis of e.g. cancer,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Neural thread protein; NTP; Harlil peptide; Alzheimer's disease;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAY79924
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               셤
                                                                                                                                                                                                                                            The invention describes an NTP-peptide (I) comprising at least one amino acid sequence corresponding to part of the amino acid sequence of a neural thread protein, AD7C-NTP. The invention provides a method of treating a condition requiring removal or destruction of cells of a mammal comprising administered to the mammal before, during or after mammal comprising administered to the mammal before, during or after surgical excision, transplantation, graftling, chemotherapy, immunotherapy, vaccination, thermal or electrical ablation, cryotherapy, immunotherapy, phototherapy, gene therapy and/or radiation. The method is useful for treatment of benign or malignant tumour; hyperplasia, useful for treatment of benign or malignant tumour; hyperplasia, bypertrophy or overgrowth of tissue, virally, bacterially or parasitically altered tissue, malformation of tissue selected from lung, breast, stomach, pancreas, prosette, bladder, bone, ovary, skin, kidney, breast, stomach, pararthyroid, thyroid, there, spinal, cord, muscle, connective tissue, adrenal, parathyroid, thyroid, theres, testis, putultary, topical and its coverings, spinal cord, muscle, connective tensies, mouth and lyamph nodes and lymphoid system; tonsilary, throat, conseils mouth and lyamph nodes and lymphoid system; tonsilary wascular disease (atherosclerosis or arteriosclerosis); haemosthoids;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   disease. This is the amino acid sequence of a human neural thread protein AD7C-NTP peptide fragment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      deficiency disease; poisoning; intoxication; environmental disease; radiation disease; endocrine disease; degenerative disease and mechanical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               varicose veins; inflammatory disease; autoimmune disease; metabolic disease; hereditary/genetic disease; traumatic disease; physical injury; nutritional deficiency disease; infectious disease; amyloid disease; fibrosis disease; storage disease; congenital malformation; enzyme
                                                                                                                                                         Novel peptides similar in amino acid sequence to neural thread proteins (NTP), useful for treating unwanted cellular proliferations such as malignant tumors and prostatic hyperplasia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Nootropic; neuroprotective; cell death; tissue necrosis; NTP; neural thread protein; neurodegenerative disorder; Alzhelmer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

```
The invention relates to a novel method for preventing and/or inhibiting cell death and/or tissue necrosts in a tissue comprising contacting the live tissue with at least one segment of neural thread proteins (WTP). The methods are composition are useful for treating a neurodegenerative disorder, such as Alzheimer's disease. This sequence represents an NTP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Papillomavirus; PV; infection; cell proliferation; B2; peptidomimetic; B1; antiviral; virucide; cytoetatic; antiproliferative; dermatological; preneoplastic lesion; neoplastic lesion; cutaneous lesion; wart; epidermodysplasia verruciformis; anorectal carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Use of papillomavirus E2 protein peptidomimetics for treating papillomavirus-infected cells and papillomavirus-induced conditions in mammals by inhibiting E1-E2 interaction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

assays by replacing NTP with the peptide in such an assay. The Harilipeptides are also useful as a trap material in a diagnostic or therapeutic assay. Therefore, the Harilipeptides are useful in binding assays, protein and antibody purification, therapeutics or diagnostics in particular, the peptides are also useful for diagnosing Alzheimer's disease, Down's syndrome, neuroectodermal tumours, astrocytomas, glioblastomas, hypoxia, ischaemia or cerebral infarction. The peptides are also useful as targets for drug development for the treatment of these diseases. The present sequence represents a specifically claimed

88888888888888888

sequences can be used as analogues for NTP in therapeutic or diagnostic

```
The present invention describes a neural thread protein (NTP) peptide having an amino acid sequence selected from ABBB1511 to ABBB1529 and their homologues, which are referred collectively as Harlil peptides (I). (I) have neuroprotective, nootropic, vasotropic and cerebroprotective activities, and can be used in peptide therapy. The Harlil peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New Harlil peptide sequences of the Neural Thread Protein, useful in therapeutic assays, e.g. as targets for developing drugs for treating Alzheimer's disease, ischemia or cerebral infarction, or for diagnosing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim 3; Page 30; 53pp; English.

The present invention describes the use of a small organic compound (A) which competitively inhibits interaction of a papillomavirus (PV) E2 protein with a PV E1 protein for treating a cell infected with PV or a mammal with a PV-induced condition. (A) has antiviral, virucide, Cytostatic, antiproliferative and dermatological activities. Methods from the present invention can be used to treat PV-induced conditions including growth of PV preneoplastic and neoplastic lesions, cutaneous lesions chosen from warts and other benign cutaneous lesions, plantar varts (vervuca plantaris), common warts (vervuca planta), common warts (vervuca planta), plantal, plantar, genital warts (condyloma acuminatum) and epidermodysplasia verruciformis, laryngeal, oral, pharyngeal, oseophageal and other upper airway papilloma or vaginal, cervical, vulvar, penile and anocetal carcinoma. The E2 inhibitors may also be used to treat epithelial and internal fibropapilloms in animals. The present sequence represents a peptide sequence used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

(first entry)

27-MAR-2003

ABJ19439;

ABJ19439 standard; peptide; 15 AA.

The invention relates to a novel method for preventing and/or inhibiting cell death and/or tissue necrosis in a tissue comprising contacting the live tissue with at least one segment of neural thread proteins (NTP). The methods are composition are useful for treating a neurodegenerative disorder, such as Alzheimer's disease. This sequence represents an NTP peptide of the invention Preventing and/or inhibiting cell death and/or tissue necrosis in a tissue for treating a neurodegenerative disorder, e.g. Alzheimer's disease, by contacting the live tissue with at least one segment of neural thread proteins (NTP). New Harlil peptide sequences of the Neural Thread Protein, useful in therapeutic assays, e.g. as targets for developing drugs for treating Alzheimer's disease, ischemia or cerebral infarction, or for diagnosing these diseases.

Claim 3; Page 29; 53pp; English.

having an amino acid sequence selected from ABBB1511 to ABBB1529 and their homologues, which are referred collectively as Harlil peptides (I) their homologues, which are referred collectively as Harlil peptides (I).

(I) have neuroprotective, noctropic, vasotropic and carebroprotective cartivities, and can be used in peptide therapy. The Harlil peptide sequences can be used as analogues for NTP in therapeutic or diagnostic sessays by replacing NTP with the peptide in such an assay. The Harlil peptides are also useful as a trap material in a diagnostic or therapeutic assay. Therefore, the Harlil peptides are useful in binding assay, protein and antibody purification, therapeutics or diagnostics.

In particular, the peptides are also useful for diagnostics.

In particular, the peptides are also useful for diagnostics.

In particular, the peptides are also useful for diagnostics.

Cliphastomas, hypoxia, ischaemia or cerebral infarction. The peptides are also useful as targets for drug development for the treatment of these diseases. The present sequence represents a specifically claimed peptide from the present invention The present invention describes a neural thread protein (NTP) peptide

Novel peptides similar in amino acid sequence to neural thread proteins (NTP), useful for treating unwanted cellular proliferations such as malignant tumors and prostatic hyperplasia.

Claim 3; Page 15; 78pp; English.

The invention describes an NPP-peptide (I) comprising at least one amino acid sequence corresponding to part of the amino acid sequence of a cueral thread protein. AD7C-MPD. The invention provides a method of treating a condition requiring removal or destruction of cells of a mammal comprising administered to the mammal a therapeutic amount of (I). The treatment is administered to the mammal before, during or after surgical excision, transplantation, grafting, chemotherapy, vaccination, thermal or electrical ablation. The method is manuchherapy, phototherapy, gene therapy and/or radiation. The method is useful for treatment of benign or malignant tumour; hyperplasia, hypertrophy or overgrowth of tissue; virally, bacterially or parasitically altered tissue; malformation of tissue selected from lung, consisting stomach, pancreas, prostate, bladder, bone, ovary, skin, kidney, sinus, colon, intestine, rectum, esophaque, heart, spleen, salivary clasue, adrenal, parathyroid, thyroid, uterus, testis, pituitary, reproductive organs, liver, hair, gall bladder, eye, ear, nose, throat, consils, mouth and lymph nodes and lymphoid system; tonsillary thyertic hyperplasia; connection to a tissue; hypertrophy; prostatic hyperplasia; connection to a tissue; hypertrophy; prostatic hyperplasia; connection to a tissue; various veins; inflammatory disease; autoimmune disease; metabolic disease; inflammatory disease; autoimmune disease; metabolic disease; hereditary/genetic disease; traumatic disease; physical injury; mutritional deficiency disease; infectious disease; amyloid disease; fibrosis disease; storage disease; congenital malformation; enzyme deficiency disease; posoning; intoxication; enriconmental disease; radiation disease; degenerative disease and mechanical disease; this is the amino acid sequence of a human neural thread protein peptide fragment
